1. (Previously Presented) A semiconductor integrated circuit, comprising:
  - a ROM having bit lines extending in a first direction in a first layer; and
  - a conductive line arranged in a second layer, located above the first layer,  
said conductive line comprising:
    - a first portion of said conductive line extending in a first direction, which is parallel to the bit lines, wherein said first portion does not cross said bit lines; and a second portion that extends in a second direction, which is orthogonal to the first direction, and said second portion passes across the bit lines at a plurality of locations, wherein the conductive line partially extends in a second direction, which is orthogonal to the first direction, to pass across the bit lines, and is shaped to be a step form having a part extending in the first direction.
- 2-3. (Cancelled)
4. (Original) A semiconductor integrated circuit, according to claim 1, wherein the conductive line has two ends extending toward upper and lower portions of [[a]]the ROM block, respectively.
5. (Cancelled)
6. (Cancelled)
7. (Cancelled)
8. (Cancelled)

9. (Cancelled)

10. (Cancelled)

11. (Original) A smart card according to claim ~~[[8]]~~24, wherein  
the conductive line has two ends extending toward upper and lower  
portions of a ROM block, respectively.

12. (Currently Amended) A smart card, comprising:

a ROM;

a CPU using a runnable program fixed at the time of the manufacture of the  
component in the ROM; and

a RAM ~~enables~~enabling the CPU to enter and use temporary data during its  
operation, wherein the ROM has bit lines extending in a first direction in a first layer;  
and a conductive line arranged in a second layer, located above the first layer, the  
conductive line partially extending in a second direction, which is orthogonal to the  
first direction, to pass across the bit lines, wherein

the conductive line has two ends extending toward a right upper portion and a  
left lower portion of a ROM block, respectively.

13. (Currently Amended) A smart card according to claim 128, wherein the  
~~conductive line~~ has two ends both extending toward the same side of a ROM block.

14. (Cancelled)

15. (Currently Amended) A method for designing a semiconductor integrated circuit  
according to claim 1, comprising the steps of:

providing bit lines for a ROM extending in a first direction in a first layer;  
providing a conductive line arrangement in a second layer, located above  
the first layer, by an automatic design technique; and

rearranging the conductive line by a manual design technique so that a first portion of said conductive line extends in a first direction, which is parallel to the bit lines, and said first portion does not cross said bit lines; and so a second portion extends in a second direction, which is orthogonal to the first direction, and said second portion passes across the bit lines at a plurality of locations~~conductive line partially extends in a second direction, which is orthogonal to the first direction, to pass across the bit lines.~~

16. (Original) A method according to claim 15, wherein the conductive line is shaped to be a step form having a part extending in the first direction.

17. (Previously Presented) A method according to claim 15, wherein the conductive line is shaped so as to pass across the bit lines two or more times.

18. (Original) A method according to claim 15, wherein  
the conductive line has two ends extending toward upper and lower  
portions of a ROM block, respectively.

19. (Original) A method according to claim 15, wherein  
the conductive line has two ends extending toward a right upper portion  
and a left lower portion of ~~[[a]]the~~ ROM block, respectively.

20. (Original) A method according to claim 15, wherein  
the conductive line has two ends both extending toward the same side of

[[a]]the ROM block.

21. (Cancelled)

22. (Cancelled)

23. (Cancelled)

24. (Newly Added) A semiconductor integrated circuit, comprising:

a ROM having bit lines extending in a first direction in a first layer; and  
a conductive line arranged in a second layer, located above the first layer, wherein  
the conductive line partially extends in a second direction, which is orthogonal to the  
first direction, to pass across the bit lines, and is shaped to be a step form having a  
part extending in the first direction wherein the conductive line has two ends  
extending toward a right upper portion and a left lower portion of a ROM block,  
respectively.

25. (Newly Added) A semiconductor integrated circuit, comprising:

a ROM having bit lines extending in a first direction in a first layer; and  
a conductive line arranged in a second layer, located above the first layer, wherein  
the conductive line partially extends in a second direction, which is orthogonal to the  
first direction, to pass across the bit lines, and is shaped to be a step form having a  
part extending in the first direction, wherein the conductive line has two ends both  
extending toward the same side of a ROM block.

26. (Newly Added) A semiconductor integrated circuit, as recited in claim 4, wherein  
one of the two ends of the conductive line is arranged adjacent an upper portion of a
